FTP Configuration

To configure an FTP Server and transfer a file from one PC to another through the FTP Server.

Step 1: Open Cisco Packet Tracer.

Step 2: Drag the following devices into the workspace:

- 1 Server
- 1 Switch
- 2 PCs

Connect all the devices to the switch using Copper Straight-Through cables.

Step 3: Assign IP Addresses.

Server:
IP Address: 10.10.10.3
Subnet Mask: 255.255.255.0

PC1:
IP Address: 10.10.10.1
Subnet Mask: 255.255.255.0

PC2:
IP Address: 10.10.10.2
Subnet Mask: 255.255.255.0

Step 4: Configure the FTP Server.

Click Server → Services → FTP.

Turn the FTP Service ON.

Under User List, create a new user.

Username: cisco1 Password: test

Give the user Read, Write, Delete, Rename and List permissions.

Step 5: Create a file on PC1.

Open PC1 → Desktop → Text Editor.

Create a file named hello.txt and save it.

At this stage, the file is available only on PC1.

Step 6: Test Connectivity.

On PC1 → Desktop → Command Prompt, type:

ping 10.10.10.3

If the ping is successful, it means PC1 can communicate with the FTP Server.

Step 7: Upload the file from PC1 to the FTP Server.

On PC1 → Command Prompt, type:

ftp 10.10.10.3

Enter the login credentials:

Username: cisco1

Password: test

→Upload the file using:

put hello.txt

Now the file hello.txt is uploaded and stored on the FTP Server.

Step 8: Download the file on PC2.

Go to PC2 → Desktop → Command Prompt.

First check connectivity:

ping 10.10.10.3

Then connect to the FTP Server:

ftp 10.10.10.3

Login using:

Username: cisco1 Password: test1

To view the files stored on the FTP Server, type:

dir

To download the file by typing:

get hello.txt

The file hello.txt is now downloaded from the FTP Server to PC2.
